

The table shows the estimated cost after rebates and incentives for a 2-kilowatt (kW) solar electric system, which is the most common, at the national average installed cost (\$9 per watt). The initial cost is \$18,000. Rebates and incentives can reduce costs up to 50%. Builders who buy in bulk may receive wholesale discounts.

Thanks to skyrocketing energy prices and federal incentives, solar energy is positioned for rapid growth in coming years. In fact, the US has over 72 gigawatts (GW) of high-probability solar additions planned for the next ...

Whereas the price per watt considers the solar system's size, the price per kWh shows the price of the solar system per unit of energy it produces over a given period of time. Net cost of the system / lifetime output = cost per kilowatt hour. ...

The tool tracks historic yearly Levelised Cost of Electricity (LCOE) data for solar PV and onshore wind for selected European countries. The LCOE is used as a metric for the cost of producing electricity using wind and ...

The tool tracks historic yearly Levelised Cost of Electricity (LCOE) data for solar PV and onshore wind for selected European countries. The LCOE is used as a metric for the cost of producing electricity using wind and solar.

Solar offers a free solar cost calculator that uses Google's Project Sunroof and real-time utility rates to estimate how much you can save by going solar. Using the calculator is easy. Click the link above to open it in a new tab, and we'll talk you through how to use it!

NREL analyzes the total costs associated with installing photovoltaic (PV) systems for residential rooftop, commercial rooftop, and utility-scale ground-mount systems. This work has grown to include cost models for solar-plus-storage systems. NREL's PV cost benchmarking work uses a bottom-up approach.
