So, even though air flows faster, the denser coolant can still carry more heat energy per unit volume due to its higher density. Assuming standard conditions ( $25^{\circ}\text{C}$  or  $298\text{ K}$ ), the density  $\rho$  is around  $1.225\text{ kg/m}^3$  for air. For common coolant liquids, let's take the density of water as an example, which is approximately  $1000\text{ kg/m}^3$ . Assuming the same energy per unit volume ...
