Tecloman liquid-cooled battery with module design has ultra-high energy density for new energy consumption, peak-load shifting, and emergency standby power.

The integrated frequency conversion liquid cooling system helps limit the temperature difference among cells within 3 °C, which also contributes to its long service life. It has a nominal capacity of 372.7 kWh with a floor space of just 1.69 square meters.

The principle of liquid-cooled battery heat dissipation is shown in Figure 1. In a passive liquid cooling system, the liquid medium flows through the battery to be heated, the temperature rises, the hot fluid is transported by a pump, exchanges heat with the outside air through a heat exchanger, the temperature decreases, and the cooled fluid (coolant) flows again.
