How many solar cells are in Solarus AB Pvt cell strings?

Solarus AB PVT cell strings contain 38 solar cells connected in series. Solar cells in the concentrated side of the collector are shaded due to the presence of the aluminium frame of the PVT collector. The effects of shading and of non-uniform illumination are minimized by including bypass diodes.

How are solar cell images annotated?

Every image is annotated with a defect probability (a floating point value between 0 and 1) and the type of the solar module (either mono- or polycrystalline) the solar cell image was originally extracted from. The individual images are stored in the images directory and the corresponding annotations in labels.csv.

How do solar cells work?

The working principle of solar cells is based on the photovoltaic effect. If the photon energy is greater or equal to the energy band gap of the semiconductor material, it will give rise to the creation of electron-hole pair. This determines the minimum frequency for the light to be absorbed by the material, regardless of its intensity.

Why do we need a solar cell string model?

Moreover, the modelling can be used to define the solar cell string layout associated to different PV collector configurations in order to improve their performance accordingly with the defined requirements.

What is a solar PV module?

It has been considered all along this work PV modules that are combinations of strings of solar cells manufactured by Solarus AB (38 cells and 4 bypass diodes).
