Why did automotive lithium-ion battery demand increase 65% in 2022?

Automotive lithium-ion (Li-ion) battery demand increased by about 65% to 550 GWh in 2022, from about 330 GWh in 2021, primarily as a result of growth in electric passenger car sales, with new registrations increasing by 55% in 2022 relative to 2021.

Will global lithium demand increase 3.5 times between 2023 and 2030?

Analysts forecast that global lithium demand could increase 3.5 times between 2023 and 2030. This surge is mainly due to the increasing reliance on lithium-ion batteries for EVs and energy storage, underscoring the critical role lithium plays in the decarbonization of the global economy.

What are some new lithium battery innovations?

In addition to solid-state batteries and new electrode materials, some other lithium battery innovations are being developed. For example, researchers are developing new electrolytes that can improve the performance and safety of lithium-ion batteries.

Why are lithium-ion batteries important?

Lithium-ion batteries play a crucial role in storing and managing this decentralized energy. Beyond passenger EVs, there is increasing electrification in heavy transportation sectors, including buses, trucks, and maritime vessels. Lithium-ion batteries make these vehicles viable by providing the energy density needed for long-range travel.

Currently, the main drivers for developing Li-ion batteries for efficient energy applications include energy density, cost, calendar life, and safety. The high energy/capacity anodes and cathodes needed for these applications are hindered by challenges like: (1) aging and degradation; (2) improved safety; (3) material costs, and (4) recyclability.
